

👉 Project | Skincare Confidence by Design

In this project, you will prototype, build, and test a new digital app for L'Oréal's CeraVe skincare line that makes it easier for someone to start a skincare routine with clarity and confidence. You'll take on the role of a UX designer, and help validate a solution that builds confidence through thoughtful, human-centered design.

You'll start by reviewing research insights and brainstorming creative ideas. Then, you'll select one promising solution to prototype and test with users.

Step 1: Research

Before you can brainstorm solutions, you need to understand who you're designing for and what problems they're facing. Your research team provided the following problem statement and research insights. Read them carefully, they form the basis of the problem you are attempting to solve!

Problem Statement

Many people trying to start a new skincare routine feel overwhelmed by their options and conflicting online advice, and are unsure how to evaluate which products will actually work for their skin.

Research Insights

Based on one-on-one interviews with 7 participants actively trying to start a skincare routine for the first time, the research team identified the following:

- **Newcomers feel unsure who to trust.** When researching skincare advice, users bounce between TikTok, Reddit, and brand websites,

encountering contradictory recommendations. Many follow influencers whose routines don't match their own needs.

- **Newcomers are discouraged by slow results.** Participants expected quick improvement. When changes weren't visible in days or weeks, they lost motivation or switched products too soon.
- **Newcomers worry about choosing the wrong product.** Some hesitated to start a routine, afraid of choosing the wrong product and causing irritation or breakouts.

Step 2: Ideation (20pt)

Now that you understand your users' challenges, it's time to start generating ideas for the app you'll build to solve them. Try the following methods to generate as many ideas as you can. These should be high level ideas for the functionality and experience your app will deliver.

- A **Crazy 8s sketching exercise** to quickly generate ideas on paper.

Don't worry about the practicality of your ideas just yet. This is your chance to get creative and explore different angles. They don't all need to be groundbreaking! You will choose only one of these ideas to develop further.

Choose your three most promising ideas. In the box below, describe each idea in 1-3 sentences – Just enough to clearly explain what it is and how it solves the users' problem. Be sure to align your ideas with the research provided.

(Paste or write your answer below 📌)

1. Ingredient/Product Checker

An app where users can search or scan a product to see how compatible its ingredients are with their skin concerns. Before entering the app, users should complete a short screening about their skin type and concerns so the app can flag products that may cause irritation or conflict with their needs. Additionally, they'll have the option to add an item to their personal list if they are interested.

2. Routine Builder

An app that helps users build a skincare routine step by step. Users first complete a screening covering their skin type, concerns, and other characteristics, then the app recommends products or lets them build their own routine manually. An integrated progress tracker helps users see how their skin changes over time, so they understand results take weeks, not days.

3. Skincare Encyclopedia

An app that serves as a global skincare encyclopedia by letting users browse and share routines from people around the world. A shared library holds information on skincare products and their ingredients, so users can view or copy routines and see exactly what's in them. The app also runs a screening to match each user's concerns with ingredients that suit them.

Step 3: Wireframe (30pt)

Choose your best idea. Create 2–3 low-fidelity wireframe sketches that represent key parts of your app idea. **Keep it simple and no AI.** Your goal is to flesh out your idea and quickly create something you can test with users.

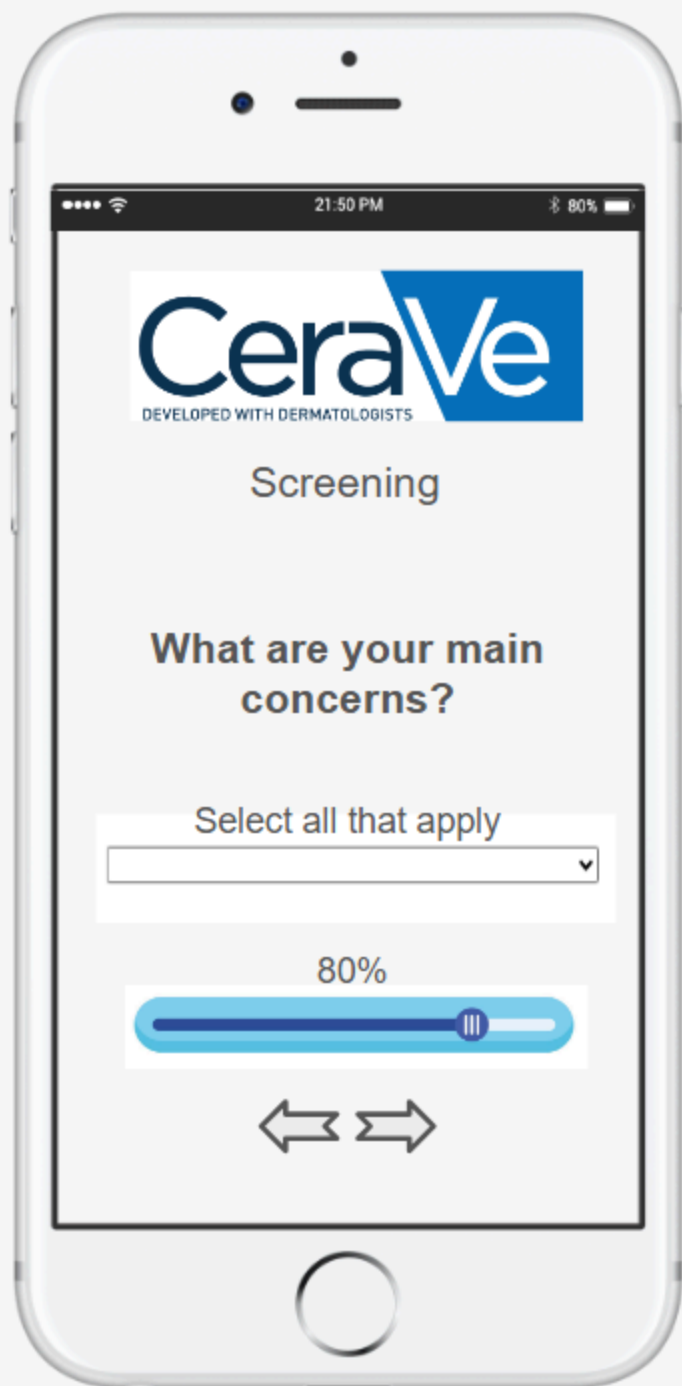

Your sketches don't need to be polished or artistic. Basic stick figures, arrows, and labels are totally fine. The goal is to communicate your idea clearly, not to create a finished design.

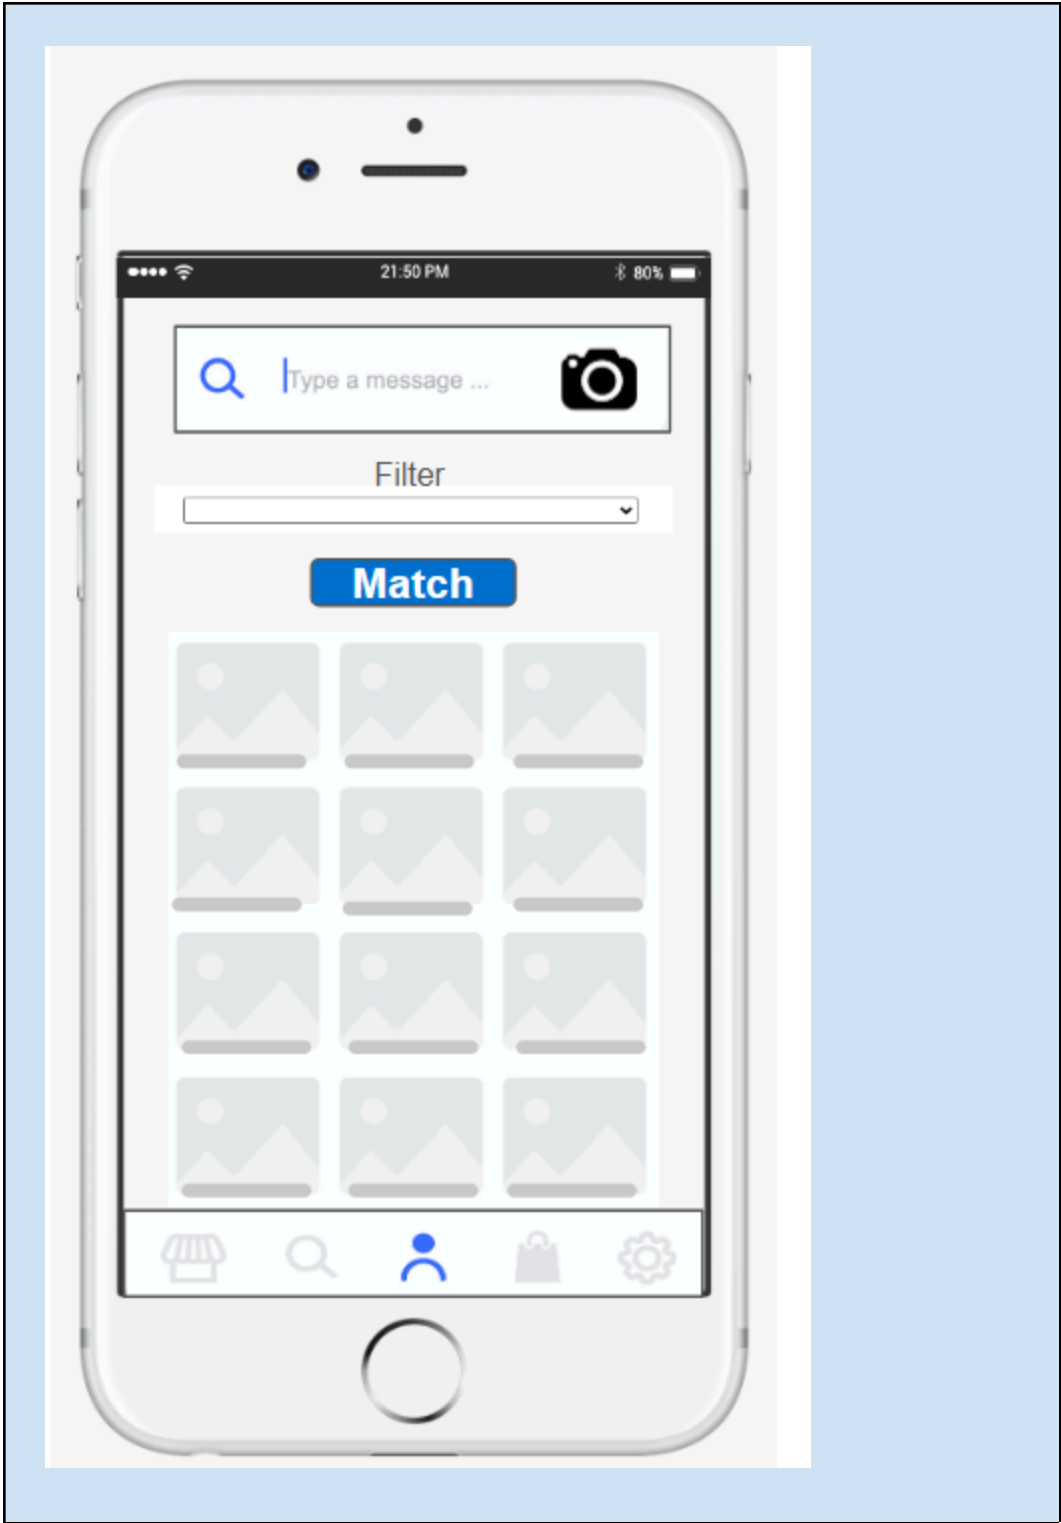

Your sketches might include:

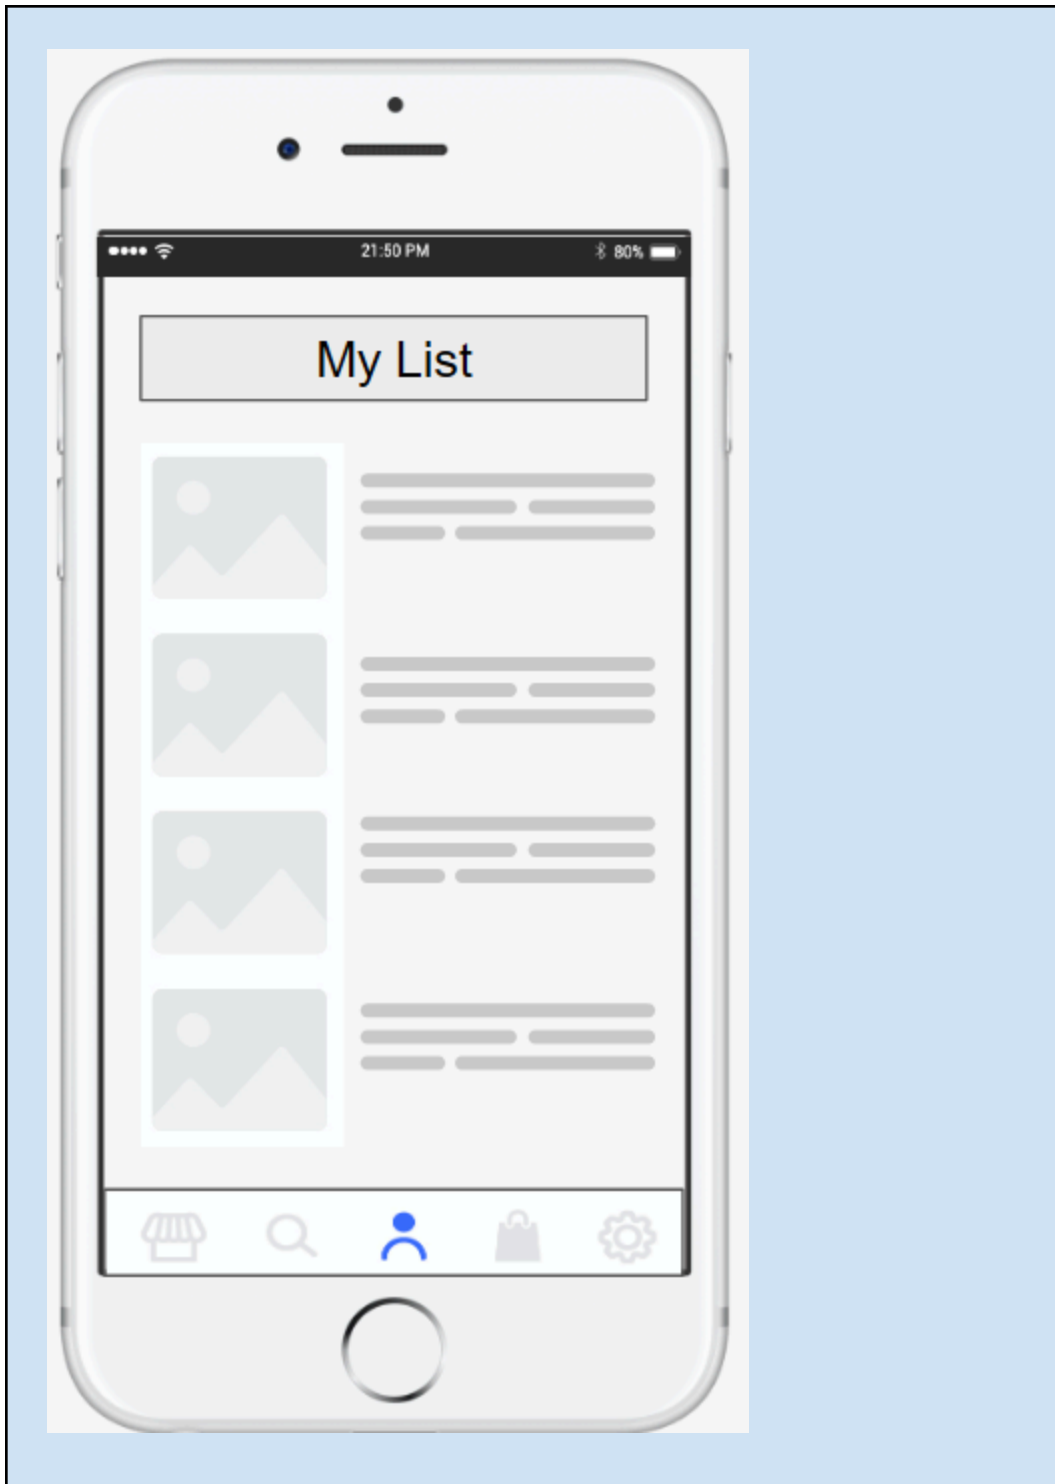

- A user's first encounter with your solution
- A step where the user takes action or makes a decision
- A moment where the user sees a result or gets feedback

Need help getting started? Find blank mobile screens and app design elements in our [UX Prototype Template](#).

Please paste clear images of your hand-drawn sketches/ UX Prototype Template below. Consider that these are prototypes/ wireframes, *not the final product*:

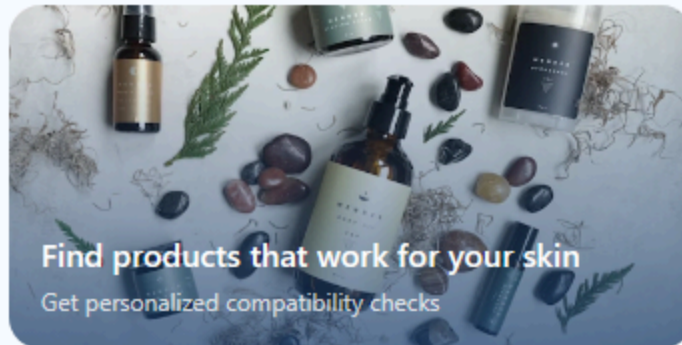

Step 4: Mock Up Your Idea (10pt)

Choose a digital wireframing tool, either [Figma](#) or [Balsamiq](#) to create a polished, clickable prototype link.

Paste your clickable, ***public***, prototype link here. Make sure to test the link in incognito mode first to ensure anyone can view it:

Step 5: Test (20 pt)

Define a few short, realistic tasks a user might want to accomplish on your app (i.e. search for a product, build their profile, consult with an AI advisor).

Then, find 1-3 friends, family members, or kind strangers willing to test out your design. Ask them to complete the tasks, and observe. **Avoid giving them instructions or answering questions on how to use the app.** Explain to your user that you want to see how they'd interact with it if you weren't there.

Write down what you observe:

- Did your tester(s) know what to click on?
- Were they able to complete the tasks?
- Were the testers surprised by anything? Delighted? Annoyed?

Summarize what you observed during testing below.

(Paste or write your answer below 📌)

Tasks: "Complete the skin screening to set up your profile";
"Search for a product and check if it's a good match for your skin"
"Save a product to My List";

Tester 1 (sister)

The tester found the "Browse Products" button on the home screen right away and moved through the screening flow without any hesitation, tapping through the skin type and concerns steps quickly. When searching for a product, they went straight to the search bar and immediately understood the Good and Caution tags on each product card. They said that the color coding made it easy to trust the result quickly. Saving a product to "My List" was relatively intuitive as they

tapped the save option without needing to look around for it. They completed all three tasks very efficiently and quickly.

Tester 2 (friend)

This tester also moved through the app quickly and confidently. They completed the screening step without pausing, picking their skin type and concerns right away. On the Browse screen, they noticed the scan icon next to the search bar and mentioned they liked having both options available. They understood the Good and Caution tags immediately and said it made choosing between products feel intuitive and nice. Saving a product to "My List" was intuitive, and they navigated back to Home afterward without any prompting needed.

Step 6: Reflect and Iterate (20pt)

A. Given what you learned in testing, what would you add or change in your next iteration? What additional tasks would you like users to complete on the app? Do you need to fix anything? What additional features might add value?

(Paste or write your answer below 📌)

Since both testers completed all tasks fairly easily, I'd focus on adding depth (more features and utilities) instead of fixing usability. Next iteration, I'd add a product detail screen showing the specific ingredients behind each Good or Caution tag so that users understand the reasoning behind the labels (gives justification for ingredients). I'd also add a task that encourages building a full routine instead of just checking individual products. Other valuable features could include reminders to redo the screening over time and a way to compare two products side by side in case the user has a dilemma on which one to choose (if they both match concerns).

B. Imagine that you're telling an interviewer about this project. Write out what you would say, including what the challenge was, how you approached it, what your app idea was, and what you learned from testing it with users.

(Paste or write your answer below 📌)

"I did a project for L'Oréal's skincare brand, CeraVe. The challenge was that first-time skincare users feel overwhelmed by conflicting advice online and fear the consequences of choosing incorrect products.

I started by using my own experience and research, then proceeded to build an ingredient and product compatibility checker. Users should complete a quick screening on their skin type and concerns, then search or scan products to see a clear Good or Caution match. If they like the product they've found, they have an option to save products to a personal list for future reference.

I sketched wireframes, then built a clickable prototype in Figma. When I tested it, both users completed every task with no issues and noted that the Good and Caution tags were a highly trustworthy aspect of the app. This helped reinforce that my core idea was working, and indicated where I needed to add more depth, such as explaining the ingredient reasoning behind each match."
