

👍 Project | AI and Your Future

In this Project, you will explore AI concepts, experiment with AI tools and reflect on your learnings about this technology and what it means for you.

1. What Do You Think? (10pt)

In the video “How do you feel about AI?” Dr. Marily Nika presented an optimistic view on AI, predicting that it will create new jobs, just like the Internet and other technologies did. Conversely, Stuart Russell in the TedEd video (based on speech at the World Economic Forum) warned that AI could lead to economic instability if not managed well.

Reflect on this question, and write up a short paragraph explaining which of these views do you personally lean towards more — and why?

(Paste or write your answer below 📌)

Overall, I lean more towards the optimistic view on AI due to its ability to make processes more efficient. Although issues with economic instability may arise, I believe the development of technology and the internet has always aimed towards elevating the standard of living. Those inventions also replaced jobs, similar to what people fear AI is capable of doing. In short, AI is a result of humanity's efforts, just like any other past invention, and it is helping make strides in optimizing systems and work, thus improving our lives.

2. Try it Yourself (50pt)

2A. Pick your tools: Pick two free AI tools to experiment with. At least one should be from the list below:

- [ChatGPT](#) by OpenAI
- [Claude.ai](#) by Anthropic
- [Perplexity AI](#)
- [Leonardo.ai](#) (for generating images)
- [Freepik.com](#) (for generating images)

2B. Same Prompt, Same Tool: In one of your chosen tools, experiment with using **the same exact prompt twice**. Prompts may be about any topic (appropriate for work), but we recommend focusing on trying to complete tasks relevant to your desired professional field. If you prefer not to use your own prompts, feel free to utilize one of these examples:

- *"Draft a short mission statement for a new tech startup focused on AI-driven healthcare solutions."*
- *"Suggest a simple 3-day workout plan for beginners."*
- *"Generate a poster design for a college career fair focused on tech and innovation."*
- *"Suggest three creative event ideas for a college club trying to attract new members."*

In a short written paragraph, summarize the results of this experiment.

While using **just one tool**, did you receive the same response for the same prompt? If not, how did responses differ?

Was the variability in responses helpful, or confusing? Which response did you like better, and why? Would you adjust your prompt as a result of this experiment?

(Paste or write your answer below 📌)

Prompting ChatGPT with "Suggest a simple 3-day workout plan for beginners" twice resulted in different responses. The responses were very similar in organization, however one workout seemed to be highly catered towards full body, whereas the other was focused on strength and balance. I like the 2nd full body workout because after the steps given, it gave some additional steps that promote healthy habits such as stretching, resting, and cardio. It also gave some general tips at the end.

2C. Same Prompt, Different Tools: Next, use a prompt of your choice in **two different tools**, and compare the results. Write up a short paragraph discussing the variation in responses.

Were the outputs different? If so, how? (e.g, in style, tone, level of detail?). Which output would you consider higher quality, and why? Which tool seemed to better understand your request? Did experimenting with the tools give you a sense of which AI tool you would prefer for which kind of tasks?

(Paste or write your answer below 📌)

Prompting the same "Suggest a simple 3-day workout plan for beginners" request into a Claude produced a response that was somewhat different. It was more concise than the ChatGPT outputs albeit similar in content. Both tools gave a 3-day full-body split with similar exercises like squats, push-ups, and rows, but this version added a short cardio finisher to each day and ended by asking if I wanted the plan adjusted for equipment or specific goals. With the more personalized aspect in mind, I would consider this output higher quality since it was more compact while still covering warm-up, rest times, and progression tips. Claude seemed to understand my request just as well as ChatGPT did, but presented the plan in an easily scannable way. After comparing the two, I got a sense that I would prefer Claude for quick, organized answers, while ChatGPT felt better for longer and more detailed responses.

3. Make it Personal (15pt)

AI is impacting different fields differently, and some industries and roles are more immediately impacted than others. Do some research on a field, industry or role that you think you might be interested in pursuing.

If you are struggling to get started, consider using this prompt:

**Try this
prompt**

I'm interested in exploring how AI is *going to impact* **[field/industry/role]** in the coming years. Give me a high level summary of the main impacts so far, what experts are predicting, and how skills and roles are changing.

Provide a list of sources I could explore further, including links to articles, videos, podcasts and prominent speakers on this topic.

Provide the links to at least three resources you've used in your research, and briefly describe what you learned and how it impacted your thinking. Were you surprised by what you found? Does anything worry, inspire, or intrigue you about this information? What action steps will you take to continue to stay ahead of the curve as AI's impact across industries grows?

(Paste or write your answer below 📌)

<https://www.eecs.mit.edu/3-questions-how-ai-could-optimize-the-power-grid/>

<https://www.wscad.com/en/csia-podcast-why-ai-native-workflows-will-change-everything/>

<https://spectrum.ieee.org/data-center-jobs>

From my research, I found that AI is helping predict renewable energy output, catch maintenance issues before they cause outages, and change how electrical engineers design circuits. I also learned that AI is actually creating jobs in areas like data centers and power infrastructure because the demand for engineers with such expertise is outpacing availability.

I was surprised that AI is growing in demand for electrical engineers instead of shrinking it. It sparks hopes to see AI open up opportunities for higher level work, but it also worries me a bit, since it means an engineer's value will come down to how well they combine technical judgment with using these tools effectively. Going forward, I plan to get more comfortable with programming + data analysis alongside my coursework, follow industry updates, and keep using AI tools directly so I understand them to the extent that it can aid me in my future career significantly.

4. Make it Work for You! (15pt)

Employers are interested in AI-savvy new employees. In fact, in a [recent survey](#) 71% of employers stated that they would rather hire a less experienced employee with AI skills over a more experienced candidate without AI skills.

This suggests that job candidates who are able to articulate a high comfort level with AI on their resumes, LinkedIn profiles, and in job interviews are going to enjoy a strong advantage in the job market.

Choose one of the following job interview questions:

- Can you walk me through a recent task or project where you used AI?
- How do you evaluate the reliability and accuracy of AI outputs?
- How do you stay updated with the fast-changing AI landscape?
- What considerations do you keep in mind when deciding if you should use AI at work?

Write up your answer, just as you would deliver it in a job interview. DO NOT tell us what you will say - write the words you would use, as if quoting.

(Paste or write your answer below 📌)

"That's a really good question. To evaluate the reliability and accuracy of AI outputs, I resort to cross-checking with other sources first instead of making an uninformed conclusion immediately. If I'm using an AI tool to solve something technical, I want to ensure accuracy, so I'll run the same prompt through another AI tool. If the responses still don't give me confidence, I'll start digging into other more reliable sources, like internet documentation, trustworthy forums, or even physical references. I've also noticed that AI tends to be pretty talkative when explaining its answers, so I can often tell how confident it actually is based on how it responds to my prompt. In general, AI is a great starting point and often gets me to the right answer, but I definitely want to be confident in the result myself before just leaving it up to the AI."

Ready for a LevelUp? (Optional Extra Credit: 10pt)

Ready for more? Write up a short LinkedIn post documenting your learnings about AI and experience using it. Consider adding media for better engagement (e.g. video of yourself talking or using AI, an image of a prompt you used and the response you received, etc).

Actually posting it to LinkedIn is optional, but highly recommended! Even if you do, **please don't submit screenshots.**

Below, paste or type the text of your LinkedIn post **(extra credit: 10 pt)**

(Paste or write your answer below 📌)

Don't forget to save and submit! To submit your work, download / export this document as a PDF and then upload it to the Project submission page on HQ. You can find the option to download as a PDF from the File menu in the upper-left corner of the Google Doc interface.
